Online Movie Review System

ABSTRACT

The Online Movie Review System provides reviews and ratings to many movie, TV/web series and suggests movies and TV/web series to the users. User can recommend movies and TV/web series to his/her friends. The system application has a rich, user-friendly Graphical User Interface. It is designed as a one-stop destination for the user to access movies, TV/web series, their reviews/ratings and a plot summary. This system will allow its users to rate movies and/or TV/web series. The system will also display the information of movies including their genre, year of release, directors involved etc.

INTRODUCTION

People's opinion has become one of the most important source for various services in ever-growing popular social networks. In particular, people's opinion is a key for businesses looking for a market for their products, new opportunities and a way to manage their reputations. In general, recommendation systems are defined as the supporting systems which help users to find information, products, or services by aggregating and analysing suggestions from other users, which means reviews from various authorities, and user attributes. After viewing such reviews from others, users take their decisions. So, such reviews must be correct and verified.

Generally, the reviews are generated in graphical format. For example, star ratings. Users just have to see the ratings which are generated by analysing the ratings given by other users to that product and have to take his/her decisions. Such ratings are easy to understand but they don't give a clear idea about the quality of the product. They are helpful in the scenario where the product is either excellent or very poor. In case of an average product, star rating proves to be a bit confusing. They don't give a clear view of what the other users think of that product. If the reviews are in simple statements, it would be easy for other users to make the right decision regarding that product.

Our system is a movie review system which will generate reviews related to the movies which are released. Unlike other systems, we are going to generate a common review by analysing only the comments

of the people (no heavy feedback). This will reduce the overhead of any user who is commenting on any movie and will make the system more user-friendly. So, the system will generate better review which will be a simple English statement.

RELATED WORK-

The current model includes the movie ratings, movie summary, movie directors, movie actors, actor descriptions, current update on the upcoming movies, latest movies, lots and lots of data and ADS. The current system having all these makes it very complex. The user must have a good knowledge what he/she is looking for and also on how to look for it.

We ourselves thought to include all the possible features we can in the small knowledge of coding we have. We purposefully removed actor description, news, updates to make the system pretty straightforward and not too complex to understand. It includes the advantage of faster loading and an easier understanding on what movies to watch next.

PROPOSED SYSTEM-

Our proposed online Movie Review system is designed to provide:

1. **User login-** Valid username and password will allow the registered user to login and the system allows the user to rate movies **only once** i.e. one user can vote one movie at time.
2. **Admin login-** Valid admin username and password will allow the registered admin to login and the system allows the admin to rate, check all the users, add movies.
3. **Registration-** The system provides guest user to register on the site by filling the registration form. This will allow the user to freely rate the movies and they can see the recommended movies given by the system.
4. **Movies list-** This will provide all the movies in the database. No restrictions on the type of user. Movie title, year of release, duration, genre, directors, stars and a short summary.
5. **Top rated movies-** The system filters out the top-rated movies based on the ratings of the registered users and displays them.

6. **Latest movies-** The system filters out the latest movies based on their year of release and displays them.
7. **Recommended movies (for registered users):** The system filters out the movies based on the genre of the movie they rated the most.
8. **Star rating-** The system will have star rating.

To make it more convincing, our generation has been growing up with the technology and know how to use the technology but most of the parents/grandparents don't have the knowledge and gets confused.

This system will surely be a better option for them as it is very easy to understand and easily accessible.

CONCLUSION &

FUTURE SCOPE

This project has a user-friendly interface, which is very easy to operate, it doesn't need tons of tab changing and clicking to work. It gives all the information a person would want to know regarding a movie at one place. It's a one stop destination for all the movie lovers.

Through this project we have not only learned but also practiced well the concepts of HTML, CSS, bootstrap, PHP, MySQL, JavaScript.

Future scope-

- 1) Can be further extended for generating recommendation based on the actors starred in the previously watched movies.
- 2) Can be further extended for recommending and generating review on upcoming movies.
- 3) Can be further extended for generating recommendation for trendy online videos.
